## INSTALLATION AND MAINTENANCE INSTRUCTIONS "ADCATROL" PNEUMATIC POSITIONERS <br> PP 981

## 1. GENERAL

1. These instructions must be carefully read before any work involving products supplied by VALSTEAM ADCA ENGINEERING S.A. is undertaken.
2. The installation procedure is a critical stage in a life of a positioner and care should be taken to avoid damage to it or equipment.

## 2. MOUNTING TO LINEAR ACTUATORS

## Single-acting diaphragm actuators

Check whether the actuator is in the safety position required by the process. (Does the actuator open or close with spring force?) The mounting side is selected from the table below in accordance with the direction of action and the required direction of movement of the spindle for an increasing input signal.

| Actuator closes |
| :---: | :---: | :---: | :---: |
| with spring force | | Changeover |
| :---: |
| plate setting | | Actuator opens |
| :---: |
| with spring force | | Changeover |
| :---: |
| plate setting |

The arrow indicates the direction
of movement of the spindle at
increasing input signal.
The direction of action of the
input signal can be set on the
changeover plate 13 :
$\mathrm{N}=$ Normal direction of action
(increasing input signal produces
increasing control pressure to
the actuator)
$\mathrm{U}=$ Reverse direction of action
(increasing input signal produces
decreasing control pressure to
the actuator)

## Double-acting diaphragm actuators

For double-acting positioners the changeover plate 13 always stays in the " N " setting. The assignment of the input signal to the direction of movement of the actuator spindle is determined by the selection of the mounting side of the positioner and the piping of the positioner outputs to the actuator:

## 3. MOUNTING TO ROTARY ACTUATORS

a) Remove the transparent cover plate from the housing of the attachment kit.
b) Mount the housing of the attachment kit on rotary actuator or armature; use mounting hardware supplied by the actuator manufacturer if necessary.
c) Move actuator into the desired starting position (rotation angle $=0^{\circ}$ ).
d) Mount cam 24 in accordance with the direction of rotation of the actuator.
The linear cam is fastened to the actuator drive shaft in such a manner that the distance $x$ between the inside of the

Ensure that the feedback lever 11 is horizontal at $50 \%$ stroke.
Fasten housing cover in such a way that air vent of attached device faces downwards (see Mark 'M').

housing and the came amounts 2 mm , whereas in case of equal percentage cam the dimension $x$ is approx. 17.5 mm .

In case of inverse equal percentage cam the dimension x is approx. 18 mm .
When employing equal percentage and the inverse equal percentage cams, the range spring (yellow) EW420493013 must be installed in the positioner.
e) Fasten feedback lever 30 for the rotary actuator onto shaft 15 of positioner.
f) Mount positioner on housing of attachment kit. Attach spring 31 to feedback lever 30 and cam follower 32 against cam.
Screw positioner to housing of attachment kit. With the linear cam and the inverse equal percentage cam check whether mark 33points to the center of the cam follower 32; adjust if necessary.
With the equal percentage cam check whether the cam follower lies directly ahead of the start of the cam lobe; adjust if necessary.
g) Final mounting of feedback lever on shaft of positioner is performed at a stroke of 0 $\%$, i.e. a rotation angle of $0^{\circ}$. First loosen 5 mm A/F Allen screw of feedback lever 30 through hole 34, then press stroke factor lever 17 against stop screw 18 (see page 5) and tighten Allen screw firmly.

## Note!

If actuator moves to an end position, the mounting position of cam does not coincide with the direction of rotation of the actuator. In this case install the cam 24 in the reverse position.

inverse equal percentage

equal percentage
$A=$ Mounting position for actuator rotation $\&$
$B=$ Mounting position for actuator rotation

## 4. PNEUMATIC CONNECTIONS

Air supply (s): 1,4 to 6 bar (but not more than the max. pressure of actuator), free of oil, dust and water!
4 Pneumatic input signal (w) 6 Internal thread G $1 / 8$ for output II (y2) (only on double-acting positioners) 7 Internal thread G $1 / 8$ for supply air 8 Internal thread G $1 / 8$ for output I (y1)

## 5. ELECTRICAL CONNECTIONS OF OPTION

The safety requirements of the document EX EVE0001 as well as the requirements of the PSS EVE0101 and MI EVE0101 for the PP981 must be observed

### 5.1 Option "Limit switch"

The limit switches is an accessory either installed in the factory or retrofit.
This unit can consist of either inductive slot type sensors or micro switches.

Warning : For the connection of microswitches please refer you to the Ml (Master Instruction) and respect the safety requirements of the document EX EVE0001.

### 5.2 Option "Position Transmitter 4-20mA"

The electrical position transmitter is an accessory either installed in the factory or retrofit. It converts the stroke or rotary movement of an actuator into an electrical standard signal 4-20 mA.

## 6 SETTINGS AND START UP

### 6.1 Setting of zero point and stroke on the positioner

(see last page for the reference of the number)
Before starting with the set-up push the flapper lever 40 several times alternately to the left and right in order to align the flappers correctly.
a) Set the minimum value of the input signal w (start of stroke).
b) Turn zero screw 41 until actuator just begins to move from its end position.

c) Set maximum value of the input signal w (end of stroke).
d) Turn the stroke factor screw 42 until actuator precisely reaches its end position:
Right turn: decrease of travel
Left turn: increase of travel
Repeat the operations (a to d) $\mathbf{2}$ or $\mathbf{3}$ times in order to insure an accurate positioning.

## Note:

Changes of the gain will influence the settings of zero and span.

If the stroke cannot be adjusted with the installed spring, a suitable spring can be determined with the table on page 5 .

### 6.2 Setting the damping

The air output capacity of the positioner can be reduced by means of the damping throttle 46. Double-acting positioners are equipped with a damping throttle 47 for correcting the variable y1 and a damping throttle 48 for correcting the variable y2. In its normal setting the damping throttle is approximately flush with the amplifier housing.
The air output capacity is reduced by a factor of approximately 2.5 when the damping throttle is turned completely.

### 6.3 Setting and Start Up of position transmitter 4-20mA

Attachment and start-up of the unit to the actuator must be performed according MI EVE0101 A. At $50 \%$ stroke, the control lever must be horizontal.
The electronic connection of the position transmitter must be assured. Both LED's are then light up.

## Adjusting the start of the measuring range ( 4 mA )

a) Move the actuator to the starting position.
b) Press push button S1 „Config Output 4mA" longer than 2 seconds. During this time LED 1 lights up. After 2 seconds both LED's are light up again, the value for $4 m A$ is stored.

## Adjusting the end of the measuring range ( 20 mA )

a) Move the actuator to the end position.
b) Press push button S2 "Config Output 20 mA " longer than 2 seconds. During this time LED 2 lights up. After 2 seconds both LED's are light up again, the value for 20 mA is stored.

Random adjustment of the current values at the end pointsa) Move the actuator to the end position, where you want to adjust the current.
b) Press both buttons simultaneously for about 2 seconds. Then both LED's are alternating flashing in a slow frequency.
c) With push button S1 "Config Output 4 mA " the output current value can be decreased and with push button S2 "Config Output 20mA" the output current value can be increased. Pressing the buttons for a short moment results in a small change and pressing the button for a longer time results in a fast mode for a bigger change. The value of the current can be freely decreased between about 3,3 and increased up to $22,5 \mathrm{~mA}$.
d) Without any additional manipulations of the push buttons the new value is automatically saved. After a few seconds, the device returns into the normal operating mode, indicated by both LED's that are then light up again.

## Trouble shooting of the position transmitter

The components of the position transmitter are under constant surveillance by the installed micro controller. Errors are detected and indicated when both LED's are off or both LED's are parallel flashing at a fast frequency.
In the event of a fatal error, e.g. potentiometer not connected, an output current of more then 24 mA will be shown in addition to the error indication given by the LED's (fast flashing). In this case check the following:
a) if the potentiometer is correctly connected to the electronic board.
b) if the potentiometer is within its working span.

## VALSTEAM IDC」

When both LED's are off, the supply voltage should be checked (minimum tension, polarity).

### 6.4 Spring range

Five different springs for the travel-ranges are available for matching to the stroke and input signal range.
In the following table the stroke range is given for a normal application (4-20mA and with our standard feedback lever).

| Spring range |  | Stroke range | Remarks |
| :---: | :---: | :---: | :---: |
| Ident $\mathrm{N}^{\circ}$ | Colour | in mm | Rem |
| EW420493013 | Yellow | $8-34$ |  |
| EW420494019 | green | $17-68$ | Built-in |
| EW502558017 | - without - | $28-105$ |  |
| EW420496011 | gray | $40-158$ |  |
| EW420495014 | blue | $55-200$ |  |

### 6.5 Functional designation
