

PRESSURE OPERATED PUMPS POP-LC

DESCRIPTION

The ADCAMat POP-LC low capacity pressure operated pump is recommended in the transfer of steam condensate, oils and other non-hazardous liquids compatible with the construction, to a higher elevation or pressure.

Under certain conditions, it can drain a closed vessel under vacuum or pressure. The pump can be operated using steam, compressed air or other gases, and is manufactured in carbon steel or stainless steel.

OPERATION

Liquid flows by gravity into the pump through an inlet check valve, lifting the float. At this point, the motive fluid intake valve is closed while the vent valve is open. As the float reaches its highest position the motive fluid intake valve opens and the vent valve closes, allowing the motive fluid to enter the pump body. The pressure in the pump builds up just enough to overcome backpressure.

The pressurized liquid opens the outlet check valve and the discharge starts. The liquid discharged may be quantified through a special counter, enabling the pump to function as a reliable flow meter.

When the float reaches its lower position the motive fluid intake valve closes and the vent valve opens allowing the liquid to fill the pump once again, repeating the cycle.

MAIN FEATURES

Compact design.
Hardened stainless steel wear parts.
High-endurance inconel springs.
Low filling head to minimize installation space.
No electric requirements or NPSH issues.
Suitable for hazardous environments.
Low running costs.
Pump mechanism with 360° rotation (limited to flange bolt holes).

OPTIONS:	Level gauge. Stroke counter.
USE:	To lift steam condensate and other liquids compatible with the construction.
AVAILABLE MODELS:	POP-LCS – carbon steel. POP-LCSS – stainless steel.
SIZES:	1" x 1", 1 1/2" x 1", 1 1/2" x 1 1/2". DN 25 x 25, DN 40 x 25 and DN 40 x 40.
CONNECTIONS:	Flanged EN 1092-1 PN 16. Flanged ASME B16.5 Class 150. Female threaded ISO 7 Rp (threaded flanges). Others on request.
INSTALLATION:	Horizontal installation. An example is shown in Fig. 1. See IMI – Installation and maintenance instructions.
MOTIVE MEDIUM:	Saturated steam, compressed air, nitrogen and other gases.

SIZING

To accurately size a pressure operated pump, the following information must be provided:

1. The condensate load (kg/h).
2. The operating medium (steam, compressed air or other gases) and its pressure.
3. The total lift or backpressure in bar the pump will have to overcome. This includes the change in fluid level elevation after the pump (0.0981 bar/m of lift), plus pressure in the return piping, plus the pressure drop caused by pipe friction and other system components.
4. Available filling head in mm or any other dimension that allows its determination.

Table 1

CAPACITY CORRECTION FACTOR FOR GASES OTHER THAN STEAM					
% Backpressure vs Motive pressure (BP/MP)	10%	30%	50%	70%	90%
Correction factor	1,04	1,08	1,12	1,18	1,28

Table 2

CAPACITY CORRECTION FACTORS FOR FILLING HEADS OTHER THAN 300 mm				
PUMP SIZE	FILLING HEAD (mm)			
	150	300	600	900
1" x 1" – DN 25 x 25	0,7	1	1,2	1,35
1 1/2" x 1" – DN 40 x 25	0,7	1	1,2	1,35
1 1/2" x 1 1/2" – DN 40 x 40	0,7	1	1,2	1,35

RECEIVER

A receiver is recommended to temporarily hold the liquid and prevent any flooding of the equipment, while the pump is performing a pumping cycle. A definable length of large diameter pipe can be used. Suggested receiver sizes are shown in Table 3.

Table 3

RECEIVER			
PUMP SIZE	1" x 1" – DN 25 x 25	1 1/2" x 1" – DN 40 x 25	1 1/2" x 1 1/2" – DN 40 x 40
Pipe size with 1 m length	6"

10		880	1150
7	6	730	840
8		790	980
10		880	1090

Remark: Based on liquid specific gravity of 0,9 to 1,0.

Example

Condensate load	950 kg/h
Filling head	150 mm
Motive fluid	Compressed air
Available pressure	8 bar
Vertical lift after pump	10 m
Return piping pressure	1,2 bar
Piping friction pressure drop	Negligible

Filling head correction:

With 150 mm filling head the correction factor from Table 2 is 0,7. The corrected capacity is thus 1540 kg/h x 0,7 = 1078 kg/h.

Calculations:

Total backpressure: 1,2 bar + (10 m x 0,0981) = 2,181 bar.
Assuming steam as motive medium at a pressure of 8 bar and a total backpressure of 3 bar, then according to Table 4 a DN 40 pump, with a capacity of 1540 kg/h, is the recommended size.

Correction for air as a motive medium:

The % backpressure is 2,181 bar / 8 bar = 27%.

The correction factor from Table 1 is 1,08.

The corrected capacity is thus 1078 kg/h x 1,08 = 1164,2 kg/h, and so, a DN 40 pump is still the recommended size.

TYPICAL APPLICATIONS

CONDENSATE RECOVERY IN AN OPEN LOOP SYSTEM

The pump transfers high temperature condensate without cavitation problems.

The vent line must be unrestricted and self draining to the receiver (Fig. 1).

MATERIALS			
POS. N°	DESIGNATION	POS. N°	DESIGNATION
1	Heat exchanger	6	Check valve
2	Receiver	7	Steam trap
3	Shut-off valve	8	Air vent
4	Y strainer	9	Overflow
5	Pump	10	Vacuum breaker

Fig. 1

REMOVAL OF CONDENSATE UNDER PRESSURE WITH PUMP AND STEAM TRAP COMBINATION

The pump is installed in a closed loop with its vent connected to a pressurized receiver (Fig. 2).

When steam pressure is sufficient to overcome backpressure, the steam trap operates. As soon as, e.g., the equipment's control valve starts to modulate, the steam pressure will decrease (even vacuum can occur). The lower differential pressure decreases the steam trap ability to discharge, causing the condensate level to rise inside the body of the pump. Once the pump float reaches its higher position, the intake valve opens and steam replaces the necessary positive pressure to pump out the condensate.

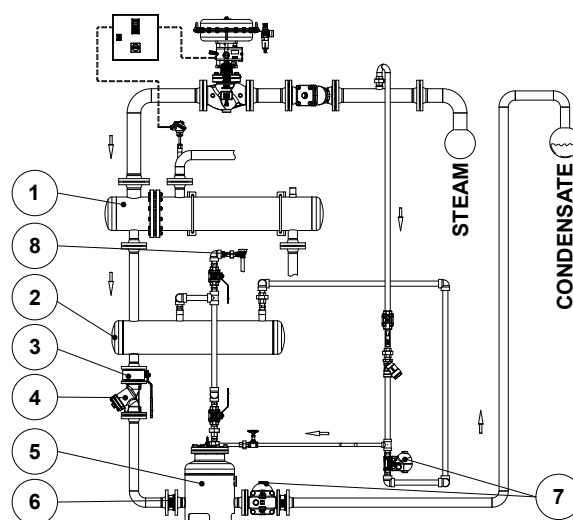

Fig. 2

DRAINAGE OF A SINGLE UNIT UNDER VACUUM

This configuration works with units operating with a minimum absolute pressure of 0,2 bar (Fig. 3).

For proper operation the filling head (H1) must range between 1 and 2 meters. The lift (H) must be as minimum as possible, but never less than 1 meter, otherwise a siphon with height (H2) is required.

Steam must be used as motive medium, and its maximum pressure should not exceed 3 bar.
